

ABSTRACT OF THE DISCLOSURE

In an apparatus for authenticating a digital signature, a signature generating part encrypts a digital document by using a private key
5 defined by a signer and digest information for checking whether the digital document has been tampered with, and generates a digital signature. A signature synthesizing part creates image information by synthesizing the digital signature and a
10 predetermined mark. And an image embedding part embeds the image information created by said signature synthesizing part into an indicated position in the digital document.
